REVIEWS

EVE, EAR, NOSE AND THIOAT. By HOWARD CHAILES BALLENGER, M.D., Professor of Oto-Laryngology in the Chicago Eye, Ear, Nose and Throat College, etc., and A. G. Wippern, M.D., Attending Oculist and Aurist to St. Elizabeth's Hospital, Chicago, etc. New second edition, thoroughly revised. Pp. 521. Illustrated with 180 engravings and S colored plates. Philadelphia and New York: Lea & Pebiger, 1917

This little text-book on the eye, cur, nose and throat, written by anthors whose names in themselves are a guarantee of excellency. now appears in its second edition. It is a small concise work written for the use of students and general practitioners. In this edition there has been a radical revision of the greater part of the hook; enlarging and improving the chapters on mutomy and methods of examining the car and adding chapters on mulformations of the external nose and the technic for tonsillectomy. The hook is well balanced, covering the whole field of the eye, eur, nose and throat and giving sufficient detail concerning the more common diseases and operations for a fairly comprehensive knowledge of the matter. We regret, however, that more space has not been given to the section on the enr, and especially to the modern method of examining the static labyrinth and its relation to cerebellar disease. Also the pathology is disuppointing, being frequently not mentioned and generally unreliable. As a practical treatise, however, we heartily recommend this book us a useful addition to the general practitioner's library, and the descriptions of the technic more of the common operations will be a great help to the beginner in this specialty. The illustrations are above the usual, and there is appended a formulary for the ear, nose and throat. G. H. W.

Modern Medicine and Some Modern Remedies. Practical Notes for the General Phactitionen. By Thomas Bodley Scott. First edition. Pp. 159. New York: Paul B. Hocher.

THE book consists of four essays upon the following subjects: disorders of the heart, arterioselerosis, therapeutic speculations, and

REVIEWS 278

doubts, and chronic brouchitis and brouchial asthma. It is of special interest, as it is a publication of facts as observed by a general practitioner. It also sets forth the difficulties of a general practitioner in handling heart and arteriosclerotic cuses.

In speaking of valvular disease as results of an infection process, there is a failure to mention tonsillitis and chorea as important ctiological factors. Syphilis, especially in America, plays a greater role in the ctiology of aortic valvular disease than the author brings

The prescleratic period is well exemplified by the author as well us the important use of the sphygmonunaneter and the simple

management of these cases.

The results of internal secretion medication are well drawn and practical. The use of untogenous vaccines, grown amaërabically, in brouchial asthmu, with their results is well shown and there is no doubt of their good effect in riding the patient of his severe broughitis after which the asthma apparently clears up.

The book is well written and should serve its purpose in stimulating other general practitioners to talculate and hand down unmy Т. К.

useful points observed at the bedside.

PHINCIPLES OF DIAGNOSIS AND TREATMENT IN HEADT AFFECTIONS. By Sin James Mackenzie, M.D., F.R.S., F.R.C.P., LL.D. Ab. and Ed., F.R.C.P.1. (Hon.), Physician to the London Hospital (in charge of the Cardine Department), Consulting Physician to the Victoria Hospital, Burnley. Pp. 264. London: Henry Frowde, Oxford University Press. Hodder & Stoughton, Warwick Square, E. C.

This book contains a series of lectures which were to have been delivered to the postgraduate students and workers at the Cardiae Department of the Laudon Hospital. The outbreak of the war having prevented their delivery the author presents them in look form.

The purpose of the lectures is not only to give the essential features concerning heart failure in a manuer useful to the practitioner, but also to offer a better insight into clinical medicine and thus stimulate research in this line. In regard to the evidences produced by mechanical aids, as the polygraph and electrocardiograph, the reader is referred to the author's book on Discuses of the Heart.

The first chapter deals with the subject of medical research and shows how the progress of medicine has been and will be delayed nutil the practitioner becomes more of an investigator. The value
